# Westminster Telephone Exchanges

# Samknows Profile of Connectivity

# Terms Used: Glossary

**Local Loop Unbundling**. The process of permitting alternative network operators to install their own equipment on a passive network. Numerous CP's provide alternative broadband services over the BT Openreach network in this way, and increasingly this approach is the default for the emerging fibre optic networks.

**21st Century Network**. BT's replacement core network, which is being rolled out between 2007 and 2012.

**Asymmetric Digital Subscriber Line**. This is the most common way in which broadband is delivered in the UK.

**Asymmetric Digital Subscriber Line, version 2+.** A form of ADSL offering up to 24Mbps downloads, and up to 2.5Mbps upstream (for the Annex M version).

**Communications Provider**. BT's terminology for their wholesale customers which are largely ISPs.

**Data Over Cable**. A technology that allows broadband data signals to be transmitted over a cable TV network. Version 3.0 permits up to 200 Mbps but more typically 50 Mbps is deployed today

**Digital Subscriber Line Access Multiplexer**. The device installed in telephone exchanges that terminates copper pairs to provide xDSL connections.

**Fibre To The Cabinet. FTTC** The process by which fibre optic cables are laid from a central point to a street cabinet. Traditional copper connections then run from the street cabinet to the premises.

**Fibre To The Premises – FTTP or sometimes FttH (home).** Fibre optic cables delivering services directly to the premises from a local POP or telephone exchange.

**Internet Protocol**. The most commonly used set of rules governing how information is sent over networks (not necessarily just the Internet).

**Internet Service Provider**. A provider of internet access services.

**Local Loop Unbundling**. The process of permitting alternative network operators to install their own equipment on a passive network. Numerous CP's provide alternative broadband services over the BT Openreach network in this way, and increasingly this approach is the default for the emerging fibre optic networks.

**Lower Super Output Area**. A standardised geographical area defined by the Office of National Statistics (ONS) for reporting purposes.

**Network operators** are organisations that own and operate their own networks. Not all ISP's are network operators as many rely on BT's infrastructure.

**Next Generation Network**. The generic name given to a new breed to communications networks. The main example of which is FttP.

**Point of Presence**. A site in which a communications provider hosts equipment for terminating connections. In BT's network this is the telephone exchange.

**Symmetric Digital Subscriber Line**. A DSL service in which the upstream and downstream channels operate at the same speed.

**The fastest member of the xDSL** family able to provide higher broadband speeds but over very short distances. This is the main technology used on FttC deployments, and is often considered as a bridge to true NGN's.

# Bloomsbury Aka Howland St Exchange

## General Information

| | |
|---|---|
| Exchange name: | Bloomsbury Aka Howland St |
| Exchange code: | WEWBLO |
| Location: | London London |
| Postcode: | W1T4JZ |
